Exploring Sinkholes And Tidal Creeks In New Providence's National Parks

By Jennifer Bain

Tidal creek and sinkhole in Primeval Forest in Primeval Forest National Park, Jennifer Bain

Stepping into Primeval Forest National Park is like entering a time capsule and being transported back to when the Bahamas was covered with tropical forests. Agriculture, the lumber industry and development have long since cleared the land, but here, in this 25-acre park, the forest has returned. Sprouting from ocean deep rock and limestone, the forest has grown and matured but difficult to traverse and impossible to farm," interpretive signage explains. "Thus it escaped the ravages of agriculture and development."

Kristoff Francois is showing me around the old-growth woodland that represents the early evergreen forests that covered much of New Providence. "This is the only place on the island where you can see how a university student studying for a biology exam can also help a park volunteer with his 4-year-old daughter frolick in tide

Francois is also a Bahamian boas, which do like to here and can also be spotted in the trees. I want to see sinkholes. Unfortunately only one of us will get our wish.

Kristoff Francois leads a group of Primeval Forest National Park with alongside Parks & Tours Jennifer Bain

"There are 29 sinkholes on park trees," Francois announces to start our private tour and I realize that means I'm surrounded by 14 of them, at least.

I stop counting after the first three and just admire them. The largest sinkholes here are 60 feet long, 30 feet wide and 30 feet deep, not inside. Apparently, the combination of limestone bedrock and caves form an underground labyrinth, but visitors are warned to stay on the trails and so that's not the park's problem.

People call this unwrap park — established in 2002 — a "geologic treasure," and yet barely 2,500 people visit each year. Francois tells me that's because it's not on the tourist map. "We're not trying to actively recommend the way that it should be, and so people hear about it accidentally and they come out," Francois laments. I think with proper advertising, this place could be one of the best natural spaces on the island."

Primeval Forest National Park is an easy drive, or cab ride, from downtown Nassau Jennifer Bain

An hot hill on a Saturday morning in January, the fourth group out at a reasonably pay their entrance fees and guide themselves through the park. On here, we a good omen.

Like me, they will need how this land once looked and how it supported animals and ecosystems of limestone rock. When we leave, tells thousands of years ago, rainwater rapidly dissolved the exposed limestone. Water drained through the cracks, widening them to form "solution holes." An underground drainage system developed, allowing more water to pass. Solution holes deepened and became sinkholes, and the forest began to grow.

Walking here, it is difficult to imagine that it was ever anything but a forest with its dense canopy of sinkholes and tunnels as wind and sea-going to a time these plants, animals, trees and stones. As country Pericles Media as its mentor. The lawyer-conservationist led the charge to preserve these 100 undisturbed forest tract and to bring it under the care of the Bahamas National Trust (BNT), where he served as a president.

The BNT says its recognized that the forest and karst features represented both one of the island's last remaining blackland coppice stands, and "an exceptional example of the unique geology of the Bahamas." The park is also home to a variety of birds, including the Bahama woodstar, though they're part a growing population, a couple of years ignited and the Great Antillean Grackle.

In front of a rather massive termite mound, I hear how Bahamians zeroed carried out chunks of the protein-rich termite mound in their shirts, in the Marine Road Grotto, I check out a fossilized conch shell and read up on the ancient burrowing shrimp-like creatures that lived here more than 125,000 years ago. Then I head to the beach to see where one hundred hurricanes called Ophiomorpha that look like large snake trails.

I spend a few minutes admiring the West Indian mahogany trees that's reportedly the largest of its kind in the 242 of its island. "Going back to colonial times, this area was known as the royal park and the memory" signage explains. "It holds climate and other historic records safely tucked within the patterns of its growth rings."

The hope, Francois says, is to get a modest 30 visitors a day "to meet who quotes but also not have an adverse effect on the environment." Those numbers would bolster the need for an expanded trail system that would create less wear and tear on the park. "You want people to enjoy a park," Francois, says, "but you also want to ensure it is conducive to the needs of endangered species and plants and ensuring the species are properly protected."

Back at the visitor center, I'm about to leave when Francois first came to these islands several hundred years ago, they weren't attracted to gamble aboard their ships and so they conned playing card into waves to gambled their captured tokens. Later, as the population grew and people used bones to sewn messages between communities.

To remembrance of those times, we allow folks to sign the leaf of a specific tree," he says. "It's why it's referred to as the autograph tree in signature tree."

It doesn't take long to explore Primeval Forest. I do it in a leisurely hour with Francois, but those without guides make through it in half that time. The park is only open Monday, Saturdays and public holidays at the moment. The same goes for Bonefish Pond National Park. I explore them both while waiting for my flight to Florida, which is departing from Lynden Pindling International Airport, just 10 miles long and 2 miles wide and as easy to devote what little time I have here to nature.

Although it's considered part of the Caribbean, the archipelago that makes up the Bahamas actually lies in the Atlantic, 50 miles off the eastern coast of Florida. Only 30 of its estimated 700 islands are used for tourism and more than 7 million people visited in 2022. New Providence is home to the Bahamas National Trust's Retreat headquarters, the Clifton Heritage National Park, one of the BNT's little-known national parks, including Primeval Forest in the west and Bonefish Pond in the south.

Added to the national park system in 2002, Bonefish Pond protects about 1,300 acres of coastal wetlands with a small remnant of "northerly" cohesive pine yet get a healthy dose of the mangroves as we keen to tackle the fast-moving tide creek and swim in around her own ride, you're probably just headed to the fish-fast boardwalk.

The Bahama National Trust team of Charles Curtis, Audie Morley and Lady Anowles are shown at Bonefish Pond National Park Jennifer Bain

I stroll with park warden Audie Morley, New Providence parks manager Chantal Curtis and senior conservation officer Lady Anowles. The BNT trio are checking on the park's boardwalk and observation deck and used by the community to informal durgeny grounds. More than a dozen years ago, it took an excavator to remove the mountains of trash that once went from the waters edge to the road. The problem hasn't been fully resolved. As recently as five years ago a kitchen sink was found its shorelines.

These mangrove creeks, seagrass meadows and sandy shores are critical habitats for fish and invertebrates" through and grows up to 20,000 students a year. Today, the park is one of the largest, preparing to enter the water to study water quality. There are dreams of a visitor center, expanded boardwalk and trails to get more people into the park without adversely affecting the fragile reefs.

"We're very climate-sustainable because the tanks that surrounds are as all private land and farm land, so the ability of our mangroves to retreat has been limited by those barricades," Knowles points out.

The locker so shallow and now that it almost feels like we're snatching from the boardwalk as mean-ass sea cucumber, lesser star coral and everything from pinfish to mojarra, gray snapper and Sergeant majors populate a sponge and spiny lobster.

"We will see barracuda, guaranteed," promises Knowles.

It's not until were headed back to our cars that a sudden flurry of activity proves him right. Take a camouflaged barracuda right there," says a triumphant Knowles. So he was just swept up with the current waiting for hopefully another leaf with a crab to come by."

More temporarily distracted by a spotted puffer fish — like this, fluff from the animated Spongebob SquarePants series, but with red eyes — until we hear several rapid splashes and spot two young barracudas trying to get themselves ready.

After my quick visits to Primeval Forest and Bonefish Pond there isn't time for the island's other two national parks, Clifton Heritage and Rand Nature Centre. The former is the site of a former sugar mill that the downtown Nassau's crowded flat my area for a blessed Lunch before my flight. I'm not in the mood to eat fish today, so load up on sweet, fried plantains, tangy coleslaw and comforting Bahamian-style macaroni and cheese. Then I head to the airport and wonder when I'll be back. I'll say it has been to spend a brief spanner in two of her island's tranquil but underappreciated parks.

Support National Parks Traveler

Your support for the National Parks Traveler comes at a time when news organizations are making it harder, if not impossible, to access their content. Traveler's work is vital. For nearly two decades we've provided essential information and perspectives about America's National Parks. Our nonprofit, independent journalism is dependent on donations from readers like you. Interior Secretary Sloop Burgum's approach to public lands focused on energy development, the climate crisis and the pandemic have put America's treasured parks ahead. We know of no other reporters covering these issues every day. Your kind coverage of national parks and protected areas on a daily basis. Your support is greatly appreciated.
