Eruption Brewing In Hawai'i Volcanoes National Park

By Jennifer Bain

Pu'u'O'o, Dec. 2022. View into the crater in Hawai'i Volcanoes National Park | Jennifer Bain

The sky glowed fierce shades of orange and red that night in February when I stood at the Kilauea Overlook and watched one of the world's most active volcanoes do its thing. I was grateful to have evaded the crowds that gather here in Hawai'i Volcanoes National Park at sunset but also serenely unnerved to be alone in unfamiliar territory just before midnight.

Peering down into Halema'uma'u crater from behind a waist-level fence, I finally got a good look at the giant lava lake that had formed when Kilauea started erupting at the start of the year. Streaks of orange lava and dramatic black patterns across the molten flow. The pressure and bubbled in spots. Blistering steam curled around a hazy pennant red from the glow of the lake and shape-shifted over the Kilauea caldera.

Two sets of people simmered at the summit, making the one-minute walk from the parking lot to the overlook in silence and keeping a respectful distance from me. Nobody spoke. Not to each other. Not to me.

The view of the lava lake from the Kilauea Overlook in February | Jennifer Bain

For 30 perfect minutes, I admired Kilauea until I thought I had seen enough. But back at Kilauea Lodge & Restaurant in Volcano Village, I was too fired up to sleep and an hour again at 4:30 a.m. to make the 10-minute drive in the dark to the summit for sunrise.

This time I would need more than — with a tad and gloves to cope with the 14° chill — for nearly two hours as the darkness lifted, the vibrant volcanic colors muted and the rest of the caldera came into focus. This time, a boisterous crowd silently gathered, jockeying for prime selfie-space along the wall, taking copious photos and videos, striking up conversations with each other, and providing a running commentary for all to hear.

"When the sun comes up, it's not so brilliant," one man mused.

"Wow. This is insane," someone else enthused.

"You don't get to see that every day," one woman said with admiration.

The sunrise crowd was small enough that the eavesdropping was entertaining and not annoying, and besides everyone seemed exuberant (just to be there witnessing something so astounding). I considered returning for a third eruption viewing at sunset when you apparently can't find a place to park, but I was concerned with raucous strangers and less focused. And I couldn't bring myself to rise on sunset mornings, even just to satisfy my curiosity about the best and worst ways to experience an eruption.

Most people come to Hawai'i Island for the sun, sand and surf. Some also come for this national park and its volcanoes — Kilauea and Mauna Loa the preferred local spelling is now one word. What I didn't grasp when I planned the latter kind of trip from my home in Toronto was that volcanoes constantly change.

This means that what my friend Jennifer Allford experienced here in 2018 when she hiked a rather gruelling 12 miles with a guide to see lava flowing across the land into the ocean was not what the Travelers Number Fat Republic witnessed in 2020 when he and his wife hiked a similar 12 miles to another popular viewing spot. It was less than 100 days from the parking lot to my entirely different viewpoint.

After sunrise, the eruption viewing becomes admittedly less exciting | Jennifer Bain

"It's never the same day twice when working in this park," Jessica Ferracane, the park's public affairs specialist, told me during a quick orientation.

Established in 1916, Hawai'i Volcanoes is a sprawling 344,481 acres and extends from sea level to 13,680 feet. What I didn't make it to the highest point, I did drive the length of Chain of Craters Road. It's 19 miles from Kilauea Visitor Center to the end of the road into the Pacific Ocean. The park is a designated International Biosphere Reserve and UNESCO World Heritage Site, but its main job is to protect, study and share the volcanoes. Kilauea and Mauna Loa are shield volcanoes with broad, gently sloping cones, spatter ramparts, fumaroles, solfataras, lava moats, lava lakes and lava tubes and thermal areas. I don't know what all those things are, but I do know that Nāhuku (Thurston Lava Tube) is also best experienced at dawn before it gets crowded and hot.

Hawai'i Volcanoes is open 24/7. In 2021, it drew 1.26 million visitors.

Ranger Naomi Kahoiula is a "Native Hawaiian — grew a talk about volcanoes on a bluff overlooking Kilauea Caldera | Jennifer Bain

"All we have all day is where do I go to see lava?" ranger Naomi Kahoiula is said with a weary sigh during his "Life on the Edge" talk at Steaming Bluff (Waihēnauapi) near the Steam Vents parking area. A "lava boy of Hawaiian descent," he explained how Kilauea is a land shaper and a land changer.

He vouched for the night-time viewing from Kilauea and Keanakāko'i overlooks that week, but said the million-dollar question is always what time to come. "Well, I can tell you between 1 and 8:30 p.m. because that's when I'm on duty and can't leave," he said. "I can't tell you what time it will be. It's not that it's like 8 p.m. there will be lava or 10 p.m. or 12 a.m. or 1 a.m. — in my opinion — 5:30 in the morning: there is no crowd. And many times, if you are not by yourself, you can hear the lava lake at night starting around. Sounds like jet engines. Sometimes it sounds like bombs."

I regret taking so caught up in watching Kilauea, and taking photos, that I didn't fully absorb what I was hearing. But when I played back a few cell phone videos, it does indeed sound like jet engines. In another sensory hunt, I will never forget how my eyes watered and my mouth dried out and tasted metallic. That's because noxious sulphur dioxide gas and other air pollutants from the volcano were rich with oxygen, atmospheric moisture and sunlight to produce volcanic smog (vog) and acid rain, which can be hazardous for people with respiratory and heart issues. Infants, young children and pregnant women.

Halpha's

Kahoiula is rounded out his short talk by showing historical photos of crowds marvelling at eruptions. There is the 1959 eruption of Kilauea Iki crater that sent lava fountains 1,900 feet into the air. And the hundred years of explosive eruptions are usually followed by 200 years of calm eruptions, he said, warning that we're about 230 years into a calm phase.

"People have been drawn to this place because of the energy that it creates and the mana (power)," Kahoiula told us. "There's a lot of metaphors that we as humans can relate to without even subconsciously thinking about. We have creation; we have fire; we have destruction; we have death — all things that we will all go through in our lifetimes. But if you have no other reason and reverence of this special place, you will be able to enjoy it."

A trail from Volcano House goes down through the rainforest to the caldera floor | Jennifer Bain

And enjoy it I did, especially when I found myself alone once again a few hours after that sunrise viewing.

Ducking through the Volcano House hotel with a side trip to its gift shop I found Hawai'ian-Pele's Trail outside its back door and followed it down 425 feet through a lush rainforest to the floor of the Kilauea Caldera. I had the trail to myself.

In an online trail guide, I read that many believe the caldera formed during an epic battle between Pele/Hawaiian Pele), the Hawaiian volcano deity, and her younger sister Hi'iaka over a love affair and an 'Ohi'a forest. The scent of it is that Pele burned her cheating lover beneath a flood of lava and when Hi'iaka dug furiously to recover the body, she formed the great caldera of Kilauea.

Beautiful but treacherous solidified lava on the caldera floor during a short hike | Jennifer Bain

From the caldera floor, I could just make out the lava lake area in the distance, by the steam clouds were white and no longer glowed orange. 'Ahu (stacked rocks) marked a short patch of trail that crossed a desolate, rocky landscape before heading back uphill through the forest. I kept my eyes on the ground and my feet gently stepped across solidified lava, mindful of steam vents, earth cracks and other natural dangers.

Less than a month later, sitting down to write about volcanoes, I kept thinking about all the tantalizing facts I've read in Canada, how no two are alike, and how each one constantly changes until it melts and disappears. I struggled with how to convey the singular beauty of what I'd been blessed to witness in Hawai'i Volcanoes National Park but also gently warn that my experience couldn't be duplicated.

When I returned to the park's website, I found this update that perfectly captures the ephemeral nature of active volcanoes: "The Kilauea volcano eruption paused on March 7th, 2023 after 82 days of activity. Activity like a see-a-night time glow are visible from at this time. Volcanic conditions can change at any time."

Support National Parks Traveler

Your support for the National Parks Traveler comes at a time when news organizations are finding it hard, if not impossible, to stay in business. Especially those, like the National Parks Traveler, dedicated to providing coverage of national parks and protected areas that, in the current administration's determination to downsize the federal government, are being starved of funds. The National Parks Traveler is a project of a non-profit, charitable organization. It's clear the Traveler will have much to cover in the months and years ahead. We know of no other news organization that provides such comprehensive coverage of parks and protected areas on a daily basis. Your support is greatly appreciated.
