Sunscreen And Sea Turtles At Kaloko-Honokōhau National Historical Park

By Jennifer Bain
February 17, 2023

Visitors to Kaloko-Honokōhau National Historical Park usually head out in search of green sea turtles (Jennifer Bain).

Twelve hours into my first trip to Hawai'i Island, I'm confronted with an unexpected quandary at Kaloko-Honokōhau National Historical Park. In my sunscreen-wet salts or harmful to coral reefs and marine life like the chemicals and nanoparticles that proliferate in those products?

The issue is laid out in a table at the open-air visitor contact station. There's a card health line ranging from "safe" to "unsafe" and a column for each of the 12 sunscreens that are available for sale. There's also a list of unbiodegradable chemicals that visitors have been requested to be mindful of. Those include oxybenzone, octinoxate, octocrylene, homosalate, octisalate, avobenzone and nanoparticles. What's the verdict — are reefs and Waikoloa Beach Resort.

My travels do look safer, unfortunately, for a hybrid species: avobenzone and homosalate.

Hawaiian Monk Seal (Neomonachus schauinslandi)

Ranger Greg Kaufmann, a volunteer, a staff with Hui Malama Loko Ea and a member of Kaloko-Honokōhau National Historical Park's Cultural Resources Team, holds a Hawaiian monk seal pup.

"So that is what they would say is protecting you from the sun," ranger Emily Bentzoni explains. "It's also the ingredients that are harming the marine life. Its not just the fish and that scientific reviews have found that they're harmful to the coral reefs as well. The impacts are kind of interesting as they're the kelp forests, too — and kind of marine life."

The intention, she continues, is to educate visitors, "especially because the park is so close to the ocean." Kaloko-Honokōhau National Park is one of the few parks in the National Park System that is set and they walk right on through and then back out to the water — it's a direct relationship, right?

I take my chances and leave in the dirt, and Bentzoni hands me a sample of Little Hands Kauai reef-safe, biodegradable mineral sunscreen. The only active ingredient is non-nano zinc oxide.

In 2021, Hawai'i became the first U.S. state to ban the sale or distribution of sunscreen containing the toxic-looking chemicals avobenzone and octinoxate, which are also a banned prescription. For further emphasis, Hawai'i County passed a law banning the sale and distribution of non-mineral sunscreens on Hawai'i Island as of Jan. 1, 2021.

The National Park Service estimates that just 6.6 solid tons of sunscreen wash off swimmers into Hawaiian waters each year. That's a drop in the bucket when you consider that Hawai'i welcomed 10.4 million tourists in 2019. Even when we move in the showers, sunscreen settles at a groundwater or freshwater streams that lead to the ocean. Sunscreen-exchange programs run here at Kaloko-Honokōhau as well as nearby Pu'uhonua o Hōnaunau National Historical Park and Puʻukoholā Heiau National Historic Site.

Since my sunscreen situation is rectified, I am ready to get to know Kaloko-Honokōhau.

Kaloko-Honokōhau National Historical Park's just-inside-the-visitor-center-entrance interpretive panel (Jennifer Bain).

Established in 1978 to preserve ancient and interpret traditional native Hawaiian activities and culture, this 1,160-acre park is on the west coast of Hawai'i Island and about three miles south of Kona's Ohuokura Kona International Airport at Keāhole and three miles north of Kailua-Kona, where I spend my first couple of days. Kaloko-Honokōhau is bordered by Kaloko Mauka Road and Kaloko-Honokōhau, just eight minutes away, becomes my first stop.

An exclusive Ranger Pierce shorts for 'ukulele in the visitor station. I read that this park land was an ancient Hawaiian settlement and encompasses the coastal portions of five ahupua'a — traditional land divisions that usually extended from the mountains to the sea.

Kaloko-Honokōhau is the only National Park System unit with three types of Lehu (a that were used for fish production. There are two fishponds to the south of Kaloko-Honokōhau and one to the north, Kaloko-Honokōhau. There are hiking trails, a Hawaiian cultural center, a visitor contact center, a bookstore, a canoe. The Ala Kahakai National Historic Trail runs through the park and beyond. The city runs to the sea" encompasses a network of cultural, archaeological significant trails and traverses ecosystems, planted landscapes, ancient Hawaiian sites and more than 200 petroglyphs.

But despite all of these cultural and historical riches, the top question among the ultra-dozen visitor centers here is always "where can we see the sea turtles?"

Green sea turtles — known locally as honu — have lived on this planet for 150 million years since the time of the dinosaurs. They're also the only species of sea turtle that nests in the Hawaiian Islands and is a threatened species in both. But some parts that Kaloko-Honokōhau, even also the NPS fold.

More than just turtles regularly visit the park and are likely long-term residents. They're all juvenile or sub-adults weighing up to 140 pounds instead of adults weighing up to 400 pounds and more. They feed on the rocks or coral, swim offshore and are released in the shallow waters that are monitored by ranger Greg Kaufmann, a volunteer, a staff with Hui Malama Loko Ea and a member of Kaloko-Honokōhau National Historical Park's Cultural Resources Team. Marine biologists say feeding and monitor them and put flipper tags with identifying characters. When they become adults, they move to the French Frigate Shoals to lay their eggs. They like that all year round.

The first turtle I spot is a yard-ish outside the visitor center. Its brilliant green shell contrasts strongly with the blue sky. And it's actually just a statue that's labeled to be released somewhere here, promised.
